

The NithinLang Masterclass

From Zero to Hero

Created by CEO Nithin | Engineered by NGI Empire

Welcome to **NithinLang**! Programming might look like magic, but it is actually very simple. Imagine you are playing with Lego blocks. By putting small blocks together, you can build a massive castle. NithinLang is exactly like that!

In this book, we will learn how to build Games, Websites, Artificial Intelligence, and Mobile Apps. Even if you are a beginner or a kid, by the end of this book, you will be a Master Creator!

Chapter 1: Getting Ready

Before we build, we need our tools. NithinLang runs on your computer.

Step 1: Install NithinLang

Open your computer's terminal (Command Prompt) and type this magical spell:

```
pip install nithinlang
```

Boom! You now have the power of NGI Empire in your computer.

Step 2: The Rules of the Magic

Every NithinLang file ends with `.nl` (e.g., `game.nl`). When you write a spell (code) in this file, you must tell the computer when to start and when to stop.

Always start your code with `nithin` and end it with `end nithin`. Also, tell the computer which language you are using: `lang+ english`.

```
nithin lang+
english

# Your magic goes here!

end nithin
```

Chapter 2: Boxes and Labels (Variables)

Imagine you have a magic box. You can put a number inside it and put a label on it called score.

```
nithin lang+
english

score = 100 player_name =
"Nithin"

raayi(player_name)
raayi(score) end nithin
```

Note: raayi is the NithinLang word for "Print" or "Show on screen".

Chapter 3: Making Choices (Logic)

Sometimes, you want the computer to make a choice. If it is raining, take an umbrella. Else, wear sunglasses.

In NithinLang, we use yadi for "If" and kadu for "Else".

```
nithin lang+
english battery =
20

yadi battery < 30:
    raayi("Please plug in the charger!")
kadu: raayi("Battery is full. Let's play!")

end nithin
```

Chapter 4: Building Your First Game

NithinLang has a built-in game engine. You don't need any extra tools! Let's draw a player on the screen.

The Game Loop

A game is just a flipbook. It draws a picture 60 times every second so it looks like it's moving. We use `game_loop(update, draw)` to do this.

```
nithin lang+
english
```

```

game_start(800, 600, "My Epic Game", 60) player_x = 400

# UPDATE: This changes the math (Physics & Controls) def update(dt):
    global player_x yadi game_key("right"):
        player_x = player_x + 5
    yadi game_key("left"): player_x = player_x -
        5

# DRAW: This paints the screen def draw():
    game_clear("black") # Clean the board

    # Draw the player
    game_draw("circle", player_x, 300, radius=50, color="cyan")

# Start the magic engine!
game_loop(update, draw) end nithin

```

Save this as game.nl and run it in your terminal:

```
nithin run game.nl
```

Press the Left and Right arrow keys. You just made your first game!

Chapter 5: Artificial Intelligence (N-Loader)

What if your code could think? NithinLang has an Offline AI Brain! You can ask it to write stories, tell jokes, or solve math problems.

```

nithin lang+
english

raayi("Waking up the AI...")

# ai_adugu means "Ask the AI"
answer = ai_adugu("Write a 2-line story about a robot who loves ice cream .") raayi("The AI says: " +
answer) end nithin

```

Chapter 6: Building a Website

You can create your own website and show it to the world using the NithinLang Web Engine!

```
nithin lang+
english

# This is what the user sees when they visit your website def home_page():
    return "<h1>Welcome to NGI Web!</h1><p>Built with NithinLang.</p>"

# Tell the server where to put the page web_route("/", home_page)

# Start the server on port 8080
raayi("Server is running on http://localhost:8080") web_start(8080) end
nithin
```

Run this file, open Google Chrome, and go to <http://localhost:8080>. You are now a Web Developer!

Chapter 7: Sharing with the World (EXE & APK)

You built a game. Now how do you give it to your friends? They don't know how to code!

NithinLang can package your code into a real App!

1. To make a Windows .exe file: Open your terminal and type:

```
nithin build game.nl
```

Look inside the dist folder. You will find game.exe. Double click it to play!

2. To make an Android .apk (Mobile App):

(Note: You need a Linux system or WSL for this)

```
nithin build-apk game.nl
```

Look inside the bin folder. You will find your APK file. Install it on your phone!

Conclusion

You have learned Variables, Logic, Games, Websites, AI, and App Building. You are no longer just a computer user; **You are a Creator.**

With NithinLang, your imagination is the only limit. Welcome to the NGI Empire! Keep Coding, Keep Building!
